1/1 point

1. In the following quiz, you'll apply the rules you learned in the previous videos to differentiate some functions.

We learned how to differentiate polynomials using the power rule:  $rac{\mathrm{d}}{\mathrm{d}x}\left(ax^{b}
ight)=abx^{b-1}$  . It might be helpful to remember this as 'multiply by the power, then reduce the power by one'

Using the power rule, differentiate  $f(x)=x^{173}$  .

- $\bigcap f'(x) = 171x^{173}$
- $\bigcirc \quad f'(x)=174x^{172}$
- $\bigcirc \quad f'(x)=172x^{173}$
- $f'(x) = 173x^{172}$

The power rule makes differentiation of terms like this easy, even for large and scary looking values of b.

**2.** The videos also introduced the sum rule:  $rac{\mathrm{d}}{\mathrm{d}x}\left[f(x)+g(x)
ight]=rac{\mathrm{d}f(x)}{\mathrm{d}x}+rac{\mathrm{d}g(x)}{\mathrm{d}x}$  .

1/1 point

This tells us that when differentiating a sum we can just differentiate each term separately and then add them together again. Use the sum rule to differentiate  $f(x) = x^2 + 7 + \frac{1}{x}$ 

- $\bigcap f'(x) = 2x + \frac{1}{x^2}$
- $\int f'(x) = 2x + \frac{1}{x}$
- $\int f'(x) = 2x + 7 \frac{1}{x^2}$
- $f'(x) = 2x \frac{1}{x^2}$
- **⊘** Correct

The sum rule allows us to differentiate each term separately.

 $\textbf{3.} \ \ \text{In the videos we saw that functions can be differentiated multiple times. Differentiate the function}$  $f(x) = e^x + 2\sin(x) + x^3$  twice to find its second derivative, f''(x).

1/1 point

- $\bigcap f''(x) = e^x + 2\cos(x) + 3x^2$
- $\bigcap f''(x) = xe^{x-1} 2\cos(x) + 6x$
- $\int f''(x) = e^x + \sin(x) + 3x^2$

You used the sum rule, power rule and knowledge of some specific derivatives to calculate this. Well done!

4. Previous videos introduced the concept of an anti-derivative. For the function  $f^\prime(x)$ , it's possible to find the antiderivative, f(x), by asking yourself what function you'd need to differentiate to get f'(x). For example, consider applying the "power rule" in reverse: You can go from the function  $abx^{b-1}$  to its anti-derivative  $ax^b$ 

0/1 point

Which of the following could be anti-derivatives of the function  $f'(x) = x^4 - \sin(x) - 3e^x$ ? (Hint: there's more than one correct answer...)

- $\square$   $f(x) = \frac{1}{5}x^5 + \cos(x) 3e^x + 4$
- $f(x) = \frac{1}{5}x^5 + \cos(x) 3e^x 12$
- $f(x) = 4x^3 \cos(x) 3e^x$
- ★ This should not be selected

The right hand side is the derivative of  $f^\prime(x)$  , rather than its anti-derivative. What function f(x) can be differentiated to give f'(x)?

- $f(x) = \frac{1}{5}x^5 \cos(x) 3e^x + 1$

This should not be selected
Check your differentiation of trigonometric functions.

5. The power rule can be applied for any real value of b. Using the facts that  $\sqrt{x}=x^{\frac{1}{2}}$  and  $x^{-a}=\frac{1}{x^a}$ , calculate  $\frac{d}{dx}(\sqrt{x})$ .

1/1 point

- $\bigcirc$   $\frac{d}{dx}(\sqrt{x}) = \frac{1}{2\sqrt{x}}$
- $\bigcirc \frac{d}{dx}(\sqrt{x}) = -\frac{1}{2\sqrt{x}}$
- $\bigcirc \quad \frac{d}{dx}(\sqrt{x}) = \frac{1}{2}\sqrt{x}$
- $\bigcirc \frac{d}{dx}(\sqrt{x}) = \frac{2}{x^2}$

This can also be useful when the power is a negative number. If you'd like to you can check that the power rule agrees with the derivative of  $\frac{1}{x}$  that you've already seen.
