1. In this quiz, you will calculate the Jacobian matrix for some vector valued functions.

1/1 point

For the function $u(x,y)=x^2-y^2$ and v(x,y)=2xy, calculate the Jacobian matrix $J=\begin{bmatrix} \frac{\partial u}{\partial x}&\frac{\partial u}{\partial y}\\ \frac{\partial v}{\partial x}&\frac{\partial v}{\partial y}\\ \frac{\partial v}{\partial x}&\frac{\partial v}{\partial y}\end{bmatrix}$

$$\bigcirc \quad J = egin{bmatrix} 2x & 2y \ -2y & 2x \end{bmatrix}$$

$$\bigcirc \quad J = \begin{bmatrix} 2x & 2y \\ -2y & 2x \end{bmatrix}$$

$$\bigcirc \quad J = \begin{bmatrix} 2x & -2y \\ -2y & 2x \end{bmatrix}$$

✓ Correct
 Well done!

2. For the function u(x,y,z)=2x+3y, v(x,y,z)=cos(x)sin(z) and $w(x,y,z)=e^xe^ye^z$, calculate

1/1 point

$$O = \begin{bmatrix} 2 & 3 & 0 \\ cos(x)sin(z) & 0 & -sin(x)cos(z) \\ e^{x}e^{y}e^{z} & e^{x}e^{y}e^{z} & e^{x}e^{y}e^{z} \end{bmatrix}$$

$$\begin{bmatrix} e^{+}e^{y}e^{z} & e^{+}e^{y}e^{z} & e^{+}e^{y}e^{z} \\ J = \begin{bmatrix} -\sin(x)\sin(z) & 0 & \cos(x)\cos(z) \\ e^{x}e^{y}e^{z} & e^{x}e^{y}e^{z} & e^{x}e^{y}ez \end{bmatrix} \\ O \\ J = \begin{bmatrix} 2 & 3 & 0 \\ \sin(x)\sin(z) & 0 & -\cos(x)\cos(z) \\ e^{x}e^{y}e^{z} & e^{x}e^{y}e^{z} & e^{x}e^{y}ez \end{bmatrix}$$

$$J = egin{bmatrix} 2 & 3 & 0 \ sin(x)sin(z) & 0 & -cos(x)cos(z) \ e^x e^y e^z & e^x e^y e^z & e^x e^y e^z \end{pmatrix}$$

$$\bigcirc \quad J = \begin{bmatrix} 2 & 3 & 0 \\ -\cos(x)\sin(z) & 0 & -\sin(x)\cos(z) \\ e^x e^y e^z & e^x e^y e^z & e^x e^y e^z \end{bmatrix}$$

✓ Correct Well done!

3. Consider the pair of linear equations u(x,y)=ax+by and v(x,y)=cx+dy , where a,b,c and d are all constants. Calculate the Jacobian, and notice something kind of interesting!

1/1 point

$$\odot$$
 $J = \begin{bmatrix} a & b \\ 1 & 1 \end{bmatrix}$

$$O \quad J = \begin{bmatrix} b & c \\ a & d \end{bmatrix}$$

$$O \quad J = \begin{bmatrix} a & c \\ b & d \end{bmatrix}$$

$$\bigcirc \quad J = \begin{bmatrix} b & c \\ d & a \end{bmatrix}$$

A succinct way of writing this down is the following:

$$\begin{bmatrix} u \\ v \end{bmatrix} = J \cdot \begin{bmatrix} x \\ y \end{bmatrix}$$

This is a generalisation of the fact that a simple linear function $f(x) = a \cdot x$ can be re-written as $f(x) = f'(x) \cdot x$, as the Jacobian matrix can be viewed as the multi-dimensional derivative. Neat!

4. For the function $u(x,y,z)=9x^2y^2+ze^x, v(x,y,z)=xy+x^2y^3+2z$ and $w(x,y,z)=\cos(x)\sin(z)e^y$, calculate the Jacobian matrix and evaluate at the point (0,0,0) . 1/1 point

$$J = \begin{bmatrix} 0 & 0 & 1 \\ 0 & 0 & 2 \\ 0 & 0 & 1 \end{bmatrix}$$

$$J = \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 1 & 1 & 1 \end{bmatrix}$$

$$J = \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 1 & 2 & 1 \end{bmatrix}$$

⊘ Correct Well done!

5. In the lecture, we calculated the Jacobian of the transformation from Polar co-ordinates to Cartesian co-ordinates

in 2D. In this question, we will do the same, but with Spherical co-ordinates to 3D.

For the functions $x(r,\theta,\phi)=rcos(\theta)sin(\phi), y(r,\theta,\phi)=rsin(\theta)sin(\phi)$ and $z(r,\theta,\phi)=rcos(\phi)$, calculate the Jacobian matrix.

$$\begin{array}{c} \bigcirc \\ J = \begin{bmatrix} rcos(\theta)sin(\phi) & -sin(\theta)sin(\phi) & cos(\theta)cos(\phi) \\ rcos(\phi) & cos(\theta)sin(\phi) & sin(\theta)cos(\phi) \\ rcos(\phi) & 0 & -sin(\phi) \end{bmatrix} \\ \bigcirc \\ J = \begin{bmatrix} r^2cos(\theta)sin(\phi) & -sin(\theta)sin(\phi) & cos(\theta)cos(\phi) \\ rsin(\theta)sin(\phi) & rcos(\theta)sin(\phi) & rsin(\theta)cos(\phi) \\ cos(\phi) & 1 & rsin(\phi) \end{bmatrix} \\ \bigcirc \\ J = \begin{bmatrix} cos(\theta)sin(\phi) & -rsin(\theta)sin(\phi) & rcos(\theta)cos(\phi) \\ sin(\theta)sin(\phi) & rcos(\theta)sin(\phi) & rsin(\theta)cos(\phi) \\ cos(\phi) & 0 & -rsin(\phi) \end{bmatrix} \\ \bigcirc \\ J = \begin{bmatrix} rcos(\theta)sin(\phi) & -rsin(\theta)sin(\phi) & rcos(\theta)cos(\phi) \\ rsin(\theta)sin(\phi) & r^2cos(\theta)sin(\phi) & rcos(\theta)cos(\phi) \\ cos(\phi) & -1 & -rsin(\phi) \end{bmatrix} \\ \end{array}$$

 \odot Correct Well done! The determinant of this matrix is $-r^2sin(\phi)$, which does not vary only with heta .
